

AMENDMENTS

In the Claims

The following is a marked-up version of the claims with the language that is underlined (“ ”) being added and the language that contains strikethrough (“~~—~~”) being deleted:

1. (Previously Presented) An input device for a computer comprising:
 - a housing;
 - a left-click actuator mounted to the housing;
 - a right-click actuator mounted to the housing;
 - a position-determining system mounted to the housing, the position-determining system being operative to determine movement of the housing and to provide a first output corresponding to the movement of the housing; and
 - a trackball mounted to the housing, the trackball being operative to rotate and to provide a second output corresponding to rotation of the trackball;wherein the right-click actuator defines an aperture and the trackball protrudes into the aperture.
2. (Previously Presented) The input device of claim 1, wherein:
 - the housing has a bottom surface; and
 - the position-determining system is operative to detect movement of the housing relative to a surface upon which the housing is placed.

3. (Original) The input device of claim 2, wherein:
the trackball is a first trackball; and
the position-determining system comprises a second trackball, a portion of which protrudes from the bottom surface of the housing such that the second trackball contacts the surface upon which the housing is placed.
4. (Previously Presented) The input device of claim 1, wherein:
the housing has a top surface; and
the trackball protrudes from the top surface of the housing.
5. (Previously Presented) The input device of claim 4, wherein:
the housing is sized and shaped to be grasped by a hand of a user; and
the left-click actuator is configured such that, when the housing is grasped by the user with the top surface of the housing substantially centered in the palm of the hand, the index finger of the user is aligned with the trackball and the thumb of the user is aligned with the left-click actuator.
6. (Previously Presented) The input device of claim 4, wherein:
the housing is sized and shaped to be grasped by a hand of a user; and
the right-click actuator is configured such that, when the housing is grasped by the user with the top surface of the housing substantially centered in the palm of the hand, the index finger of the user is aligned with the trackball and the right-click actuator.
7. - 8. (Canceled)

9. (Previously Presented) The input device of claim 1, wherein:
the housing has a centerline; and
at least a substantial portion of the right-click actuator is located left of the centerline.
10. (Original) The input device of claim 6, further comprising:
a scroll wheel mounted to the housing such that, when the housing is grasped by the user with the top surface of the housing substantially centered in the palm of the hand, the middle finger of the user is aligned with the scroll wheel.
11. (Original) The input device of claim 10, wherein at least a substantial portion of the right-click actuator is located left of the scroll wheel.
12. (Original) The input device of claim 1, wherein the housing is configured and the trackball is arranged to be operated by a right hand of a user.
13. - 19. (Canceled)
20. (Previously Presented) The input device of claim 1, further comprising:
means for providing scroll functionality.
21. (Previously Presented) The input device of claim 6, wherein the left-click actuator is configured such that, when the housing is grasped by the user with the top surface of the housing substantially centered in the palm of the hand, the index finger of the user is aligned with the trackball and the thumb of the user is aligned with the left-click actuator.

22. (Previously Presented) The input device of claim 5, wherein the right-click actuator is configured such that, when the housing is grasped by the user with the top surface of the housing substantially centered in the palm of the hand, the index finger of the user is aligned with the trackball and the right-click actuator.
